For regulated stablecoin issuers, payment rails, and FX providers

High-velocity institutional settlement and on-chain FX volume

Power T+0 stablecoin advances, DACA waterfall payouts, and automated stablecoin-to-local-currency FX liquidity across Africa.

High-frequency stablecoin and FX utility

Cross-border receivables financing creates continuous, real-economy demand for regulated stablecoins and local fiat liquidity ramps:

- **T+0 stablecoin settlement rails:** Institutional investors fund tranche tokens in regulated stablecoins (USDC, EURC, or approved tokenized bank deposits), and smart contract waterfalls execute payouts natively on-chain at T+0.
- **Instant local payout conversion:** African PSPs receiving T+0 stablecoin advances convert liquidity immediately into local operating currencies (such as NGN, KES, ZAR, and GHS) via regulated on/off-ramp partners to fund instant merchant and remittance payouts across mobile money and bank rails.
- **On-chain stablecoin AMM pools:** The exchange's automated market maker (AMM) liquidity pools route cross-border flows between USD/EUR stablecoins and local currency pairs, replacing 1.5%–3.0% correspondent bank FX spreads with transparent, low-slippage execution.

Currency risk isolation and partner economics

Integration layer	How stablecoin and FX partners participate
Fiat-to-stablecoin ramps	Provide regulated mint/redeem liquidity for fiat-wiring institutional investors and instant local-currency off-ramps for African PSPs.
FX hedging and AMM pools	Phase 1 pools prioritize USD/hard-currency corridors; as multi-currency pools scale, partners co-seed automated AMM hedging buffers that isolate cross-currency mismatches.
Recurring volume	1-to-14-day settlement cycles generate 25x–50x annual capital turnover, driving compounding mint/redeem, FX spread, and liquidity-pool fee revenue.
